

Confidently separate **challenging polar compounds** with a range of selectivity options

Agilent ZORBAX Bonus-RP, ZORBAX SB-Aq and the Polaris Family of Columns

In applications such as drug development, target compounds are growing increasingly polar. To succeed, you need a reversed phase column that ensures excellent retention under aqueous conditions (up to 100%) – while avoiding secondary interactions, phase collapse, and shifting retention times.

To help you tackle these challenges, Agilent offers a range of columns, including ZORBAX Bonus-RP and SB-Aq columns, as well as the Polaris family of polar-modified LC columns with additional polar phases in C18, C8, Amide, and Ether chemistries.

Agilent's family of polar-optimized columns utilize ultrahigh-purity silica, novel polar modified technology, and unique bonded phases that maximize polar retention and selectivity, while virtually eliminating silanol activity.

Options include:

- **ZORBAX Bonus-RP columns** deliver excellent peak shapes with an embedded polar group, steric protection, and triple endcapping. Available in a range of particle sizes, from fast LC 1.8 μm to 7 μm .

- **ZORBAX SB-Aq columns** provide exceptional lifetime at low pH through unique StableBond bonding with no endcapping. Available in 1.8 μm to 7 μm sizes.
- **Polaris C18-A and Polaris C8-A columns** offer alternate selectivities for general polar applications and are designed with hydrogen-bond accepting endcapping. Available in 3 μm , 5 μm , and 10 μm (C18-A only).
- **Polaris Amide-C18 columns** provide subtle alternative selectivity because they do not have steric protection. They utilize an embedded amide, similar to Bonus-RP columns, and are available in 3 μm and 5 μm particle sizes.
- **Polaris C18-Ether and C8-Ether columns** are endcapped with an ether group to create a more polar surface for selectivity variation. Available in 3 μm and 5 μm particle sizes.

All Agilent columns are meticulously designed and tested to meet stringent pharmaceutical requirements – from discovery to purification. They are an excellent choice for analyzing polar compounds in food safety and environmental applications.

Innovative chemistry that withstands the rigors of LC/MS

When it comes to working with polar compounds, Polaris high-throughput columns are physically and chemically up to the challenges of open access LC/MS. They are built to endure high-pressure gradient conditions. Plus, the structure of the Polaris embedded phases means no bonded phase leaching to compromise column lifetime or mass spec results.

ZORBAX Bonus-RP columns, SB-Aq columns, and the family of Polaris columns all have bonding modifications for enhanced retention of polar compounds. In addition, their stable bonded phases minimize column bleed, which can compromise mass spec results.

For LC/MS analysis of polar compounds, which requires a higher organic mobile phase, Agilent's HILIC Plus columns are an excellent complementary choice.

Overlay of LC/MS Performance Test Mix

Aspartame, Cortisone, Reserpine and Dioctyl Phthalate were chosen by Tang et. al. to evaluate RP-LC and LC/MS system performance with a sample representative of molecules encountered in drug discovery*. The compounds vary in polarity and molecular weight. In-house studies reveal that all these chemistries give good retention of Aspartame and good selectivity of Cortisone and Reserpine without lengthy retention of Dioctyl Phthalate.

Column Dimensions 4.6 x 50 mm
Mobile Phase A: Water + 0.05% HCOOH
Mobile Phase B: MeCN + 0.05% HCOOH
Flow Rate = 1.0 ml/min
Gradient 5 to 90% B in 5 minutes
Keep constant at 90% B for 6.2 minutes
Column Temperature 40 °C
Detection 220 nm

1. Aspartame MW = 294 Log P = 2.135
2. Cortisone MW = 360 Log P = 1.295
3. Reserpine MW = 608 Log P = 3.704
4. Dioctyl Phthalate MW = 390 Log P = 8.706

*Tang, L.; Fitch, W.L.; Alexander, M.S.; Dolan, J.W. *Anal. Chem.*, 2000, 72, 5211-5218.

Infinitely better technology at an infinitely better price:

The Agilent 1200 Infinity LC series

Whether you need a “workhorse” LC system for routine analysis or a sophisticated, high-resolution LC/MS system, the Agilent 1200 Infinity series has what you’re looking for.

Together with Agilent Polaris columns, our 1200 Infinity Series LC systems deliver ultimate resolution and sensitivity, while helping you boost your separation power per time. They also ensure easy method transferability between systems – without redevelopment or revalidation.

Agilent Chemistries:

Keeping you in command of your analyses

Agilent designs and manufactures columns to suit most techniques for small molecule, large molecule, and synthetic polymer analysis, allowing you to scale methods from conventional 5 μm ... to “Fast LC” sub-2 μm ... to prep.

You also have access to Agilent’s extensive applications library for faster method development – plus worldwide technical support, speedy problem resolution, and our global infrastructure and delivery network.

Agilent’s meticulous production oversight ensures column consistency and performance. With more than 40 years of experience in producing polymers and silica chemistries, our team is committed to continuously developing new column advances that make you most productive.
